Algorithms of Late-Capitalism Issue 10

# DATA GARDENS

Immerse yourself in a garden of data.

A place where data is not immaterial bits aggregated and analyzed by automated systems, but rather nurtured and cared for as material and relational.

A place full of interesting flowers and fruits that make us think differently about how we interact with data, how we value data, both our own and that of others.

Historically, gardens have been privatized spaces seen more as elitist symbols of status. However, nowadays gardens come in many shapes and sizes, often serving as a

place for community-building and care.

As you walk through this garden, you can ask: How did this garden come to be and who is tending to it? What kind of data is planted here, and what fruits do they bear? What is my place here, and what kind of future can I envision for myself in this data garden?

In this issue of ALC, we invite the participants to envision a data garden that defies current data related practices with radical concepts such as care, minimalism, community as we rethink data and its uses outside of models of extraction and instrumentalism.

**NÓBIAS**

# PLANTING THE SEEDS

Big Data encompasses automated harvesting of massive amounts of information from various sources and pooling it into large data lakes. It's about aggregation and analysis at scale as a way to create profit.

But making a garden is rarely about scale & profit. Perhaps you are simply growing some produce for yourself, or a local farmer's market. Or your flower garden is meant as a space of reflection and rest - which is also a way of harvesting the labor of gardening. If we think of community gardens as a political space where citizenship and collaborative governance is fostered, what do we harvest then?

How can we rethink how we gather data, and how we measure the value or usefulness of data, in terms of gardening?

# HARVESTING

Big Data relies on the automated gathering of massive amounts of information from various sources and pooling them into large data lakes. It's all about aggregation and analysis at scale.

What would a different data infrastructure look like if we treated data like seeds planted in a garden? When gardening we select specific seeds for a reason, carefully plant them, nurture them throughout their lifespan. Perhaps we are planting seeds to produce sustenance for ourselves or our communities? Or perhaps they are flowers that beautify the neighborhood and provide nectar for bees?

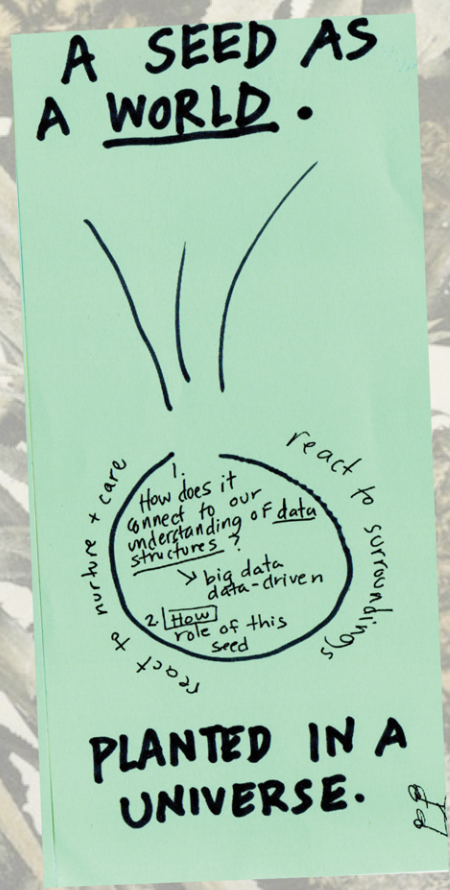

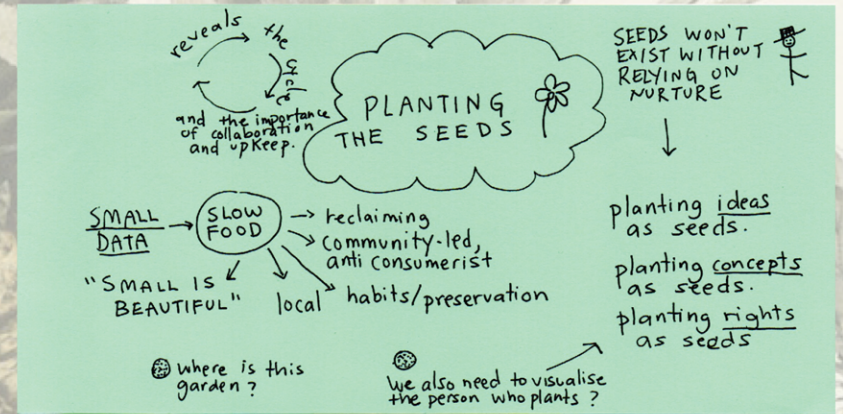

"big data" — too big for human comprehension. baren or crates barren deserts, it monopolises and creates its own conception of truth. It is authoritarian, asocial, a historical.

data-driven is machine-driven, lacking in human intuition, care and connection.

# "Data Gardening"

Growing a garden takes time, patience, and care. It can be therapeutic when done by yourself. It can be a source of community-building when done together. It can be a way to teach, learn, or pass down generational knowledge. It's often more than just about the plants and produce.

On the other hand, data-driven technologies are all too often about efficiency, speed, accuracy, and end-results. It's about optimizing for profit.

How can we rethink our data and digital technologies (and our relationship to them) in terms of gardening instead?

Big industrialized farming is very different from growing a garden. Instead of the large mechanical machines and automated irrigation systems of industrial farming, we use our hands, small shears, and perhaps a trowel, to tend to our gardens. The relationship is more tactile and intimate.

If we think about the infrastructures, tools, and systems used to generate, analyze, and use Big Data, what kind of different tools would a data garden inspire and require?
