## BACKGROUND:

- Crystal methamphetamine ('ice') use is a significant global public health concern.
- Cracks in the Ice (CITI) is the first centralised online portal for evidence-based information about the drug in Australia. The portal also provides links to treatment and support services.
- A national online survey was conducted to evaluate whether CITI is meeting the needs of the community and improving knowledge and attitudes about ice.

## **METHODS**

- N = 2,108 Australian participants.
- Cross-sectional, online survey examined participants' perceptions of CITI and their knowledge/attitudes about ice.
- The System Usability Scale (SUS) was used to assess website usability
- People who had previously visited the website and those who had not ("naïve") were recruited.
- Naïve participants undertook a guided site tour to compare their knowledge and attitudes pre and post website exposure.

## **RESULTS**

- Response to CITI was overall positive, indicating CITI is meeting the needs of the Australian community.
- The average SUS score of 73.49 (SD 13.30) indicated good site usability.
- Knowledge of ice was generally good, but many held negative or stigmatising attitudes.
- Website visitors had significantly higher baseline knowledge than naïve participants (p<.001).
- Interaction with CITI during the survey guided site tour led to immediate improvements in knowledge about ice (p<.001) and a decrease in stigmatizing attitudes (p<.001).

**CONCLUSION:** CITI demonstrates the important role of eHealth resources in improving knowledge, reducing stigma, and potentially leading to an increase in help-seeking behaviour.

**59%** female

33% from regional areas11% from rural/remote areas

Average age was 36 years

27% of participants reported previously using crystal methamphetamine

41%

had a family member or friend who they thought may be using crystal methamphetamine
