ESCORTER 100

BACKING GATE

FOR GENTLE MOVEMENT

ESCORTER 100

BACKING GATE

FOR GENTLE MOVEMENT

Going into the holding area to push your cows into the milking parlour is a waste of time. It is stressful for the animals and tiring for the parlour operator.

The Escorter 100 is a smart system that gently pushes the cows towards the milking parlour. This helps ensure that the cows move properly, in a totally relaxed atmosphere.

Using a backing gate is known to save about 15 minutes of milking time per 100 cows, while reducing musculoskeletal problems.

BENEFITS AT A GLANCE

- **Save time** - No manual operation is needed. The operator can focus on their milking routine instead of operating a manual crowd gate. When the last cow enters the milking system, the Escorter 100 safely and automatically lifts and returns to the entrance of the holding area for the next group of cows.
- **Adapts** to any stall configuration (parallel, herringbone or rotary).
- **Gentle and safe** - The Escorter 100's variable speed advance and return allows gentle, safe delivery of the cows to the milking parlour. None of the structures that come into contact with the cows are connected to electricity, which allows stress-free movement into the parlour.
- **Automatic advance** - At each exit for herringbone or parallel parlours. After a pre-determined number of cows for rotary parlours.
- **Scraper option** - to save on cleaning time, you can opt to have a scraper mounted on the Escorter 100 gate. It cleans the holding area each time it passes through the area, and after milking.
- **Lifting gate option for multiple groups** - To separate the groups of cows before they enter the milking parlour. When the last cow in the group enters the milking parlour, the vertical lifting gate returns to its initial position and gently pushes the next group towards the milking parlour.
