Questions in first-order logic

Ivano Ciardelli

PhDs in Logic XIII — Torino, September 1st 2022

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Traditionally, in logic we focus on a special class of sentences: we deal with statements like (1) but not with questions like (2)

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬぐ

- (1) Some EU countries are monarchies.
- (2) Which EU countries are monarchies?

Traditionally, in logic we focus on a special class of sentences: we deal with statements like (1) but not with questions like (2)

- (1) Some EU countries are monarchies.
- (2) Which EU countries are monarchies?

Why?

A fundamental theoretical role is played by the notion of truth:

logical operators are analyzed in terms of truth-conditional contribution;

Traditionally, in logic we focus on a special class of sentences: we deal with statements like (1) but not with questions like (2)

- (1) Some EU countries are monarchies.
- (2) Which EU countries are monarchies?

Why?

A fundamental theoretical role is played by the notion of truth:

logical operators are analyzed in terms of truth-conditional contribution;

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ● ●

entailment is construed as necessary preservation of truth;

<u>ا ا</u>

But truth is not applicable to questions. E.g., is (2) true or false?

Nevertheless, it is possible extend logic to questions in a natural way. $\rightsquigarrow~$ Inquisitive Logic

Inquisitive first-order logic, InqBQ

A conservative extension of classical first-order logic with questions.

Inquisitive first-order logic, InqBQ

A conservative extension of classical first-order logic with questions.

In this logic we can regiment a broad range of question types:

- a. Does every object satisfy P?
 b. What is one object satisfying P?
 c. What are the objects satisfying P?
 d. What is the object satisfying P?
 - e. ...

polar mention-some mention-all unique-instance

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Inquisitive first-order logic, InqBQ

A conservative extension of classical first-order logic with questions.

In this logic we can regiment a broad range of question types:

polar	Does every object satisfy P?	(3) a.
mention-some	What is one object satisfying <i>P</i> ?	b.
mention-all	What are the objects satisfying <i>P</i> ?	с.
unique-instance	What is the object satisfying <i>P</i> ?	d.
		0

We can study the interesting ways in which such questions are logically related and make inferences with questions.

Aim of this talk

- Introduce inquisitive first-order logic
- Survey some important open problems and recent advances

(ロ)、(型)、(E)、(E)、 E) の(()

Part 1 Foundations of inquisitive logic

▲□▶ ▲圖▶ ▲≣▶ ▲≣▶ = のへで

Intensional semantics

In intensional semantics, a model comes with a universe W of possible worlds, which represent different ways things could be.

Example

A die has been rolled. There are six "ways things could be" w.r.t. the outcome.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Standardly, semantics is given by a relation:

Inquisitive semantics

Semantics given by a relation:

Information states

An information state is modeled as a set $s \subseteq W$ of possible worlds:

- the worlds $w \in s$ are **compatible** with the information in *s*;
- ▶ the worlds $w \notin s$ are **ruled out** by the information in *s*.

Information states

An information state is modeled as a set $s \subseteq W$ of possible worlds:

- the worlds $w \in s$ are **compatible** with the information in *s*;
- the worlds $w \notin s$ are **ruled out** by the information in *s*.

・ロト ・ 目 ・ ・ ヨト ・ ヨ ・ うへつ

For convenience, I restrict to **consistent** information states, i.e., $s \neq \emptyset$.

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

Part 2.1

Re-implement classical FOL based on support

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Standard ingredients

- ▶ Signature S: for simplicity, only predicate symbols.
- An infinite stock of first-order variables (x, y, z, ...).

Classical formulas

$$\alpha ::= R(x_1, \ldots, x_n) \mid (x_1 = x_2) \mid \bot \mid \alpha \land \alpha \mid \alpha \to \alpha \mid \forall x \alpha$$

Defined operators

- $\blacktriangleright \neg \alpha := \alpha \to \bot$
- $\bullet \ \alpha \lor \beta := \neg (\neg \alpha \land \neg \beta)$
- $\blacksquare \exists x \alpha := \neg \forall x \neg \alpha$

This is essentially the standard language of first-order logic.

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Models

- a non-emprty domain D of individuals;
- ▶ a non-empty universe *W* of possible worlds;
- ▶ for each world *w* and each predicate *R*, a suitable extension $R_w \subseteq D^n$.

Remark

With a world *w* we can associate a relational structure $M_w = \langle D, \{R_w \mid R \in S\} \rangle$.

Example

Signature: a unary predicate P.

► *D* = {*a*, *b*}

•
$$W = \{w_1, w_2, w_3, w_4\}$$

• $P_{w_1} = \{a, b\}, \ P_{w_2} = \{a\}, \ P_{w_3} = \{b\}, \ P_{w_4} = \emptyset$

Support for classical formulas

Given a model $M = \langle W, D, I \rangle$, a state $s \subseteq W$, and an assignment $g : Var \rightarrow D$:

►
$$s \models_g R(x_1, ..., x_n) \iff \forall w \in s : \langle g(x_1), ..., g(x_n) \rangle \in R_w$$

► $s \models_g x_1 = x_2 \iff g(x_1) = g(x_2)$ (simplification)
► $s \nvDash_g \bot$
► $s \models_g \varphi \land \psi \iff s \models_g \varphi$ and $s \models_g \psi$
► $s \models_g \varphi \rightarrow \psi \iff \forall t \subseteq s : t \models_g \varphi$ implies $t \models_g \psi$
► $s \models_g \forall x\varphi \iff s \models_{g[x \rightarrow d]} \varphi$ for all $d \in D$
$\begin{array}{l} {\sf Truth} \\ {\it w} \models_{\it g} \alpha \ \stackrel{\it def}{\Longleftrightarrow} \ \{{\it w}\} \models_{\it g} \alpha \end{array}$

<ロト < 回 ト < 三 ト < 三 ト 三 の < で</p>

Truth
$$w \models_g \alpha \iff \{w\} \models_g \alpha$$

Proposition

 $w \models_{g} \alpha \iff M_{w} \models_{g} \alpha$ in Tarskian semantics for FOL

$$\begin{array}{l} \operatorname{Truth} \\ w \models_{g} \alpha \iff \{w\} \models_{g} \alpha \end{array}$$

Proposition $w \models_g \alpha \iff M_w \models_g \alpha$ in Tarskian semantics for FOL

Proposition (Truth-support bridge) For every classical formula α : $s \models_g \alpha \iff \forall w \in s : w \models_g \alpha$.

$$\begin{array}{l} \operatorname{Truth} \\ w \models_{g} \alpha \iff \{w\} \models_{g} \alpha \end{array}$$

Proposition $w \models_g \alpha \iff M_w \models_g \alpha$ in Tarskian semantics for FOL

Proposition (Truth-support bridge) For every classical formula α : $s \models_g \alpha \iff \forall w \in s : w \models_g \alpha$.

Illustration

Maximal supporting states for some classical formulas

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Proposition: conservativity over classical FOL For any set $\Gamma \cup \{\alpha\}$ of classical formulas:

 $\mathsf{\Gamma} \models \alpha \iff \mathsf{\Gamma} \models_{\mathsf{FOL}} \alpha$

<□▶ <□▶ < 三▶ < 三▶ < 三▶ 三三 - のへぐ

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

Part 2.2 Enrich FOL with questions

(ロ)、(型)、(E)、(E)、 E) の(()

Full language of InqBQ

$$\varphi ::= R(x_1, \dots, x_n) \mid (x_1 = x_2) \mid \perp \mid \varphi \land \varphi \mid \varphi \rightarrow \varphi \mid \varphi \lor \varphi \mid \forall x \varphi \mid \exists x \varphi$$

Think of \vee and \exists as a question-forming operators:

- $\alpha \lor \neg \alpha \iff$ that α is true or false
- $\alpha \otimes \neg \alpha \rightsquigarrow$ whether α is true or false (? $\alpha := \alpha \otimes \neg \alpha$)
- ▶ $\exists x \alpha(x) \quad \rightsquigarrow \text{ there is an } x \text{ such that } \alpha(x)$
- $\exists x \alpha(x) \rightsquigarrow$ what is an x such that $\alpha(x)$

Full language of InqBQ

$$\varphi ::= R(x_1, \dots, x_n) \mid (x_1 = x_2) \mid \perp \mid \varphi \land \varphi \mid \varphi \rightarrow \varphi \mid \varphi \lor \varphi \mid \forall x \varphi \mid \exists x \varphi$$

Is the set of validities recursively enumerable?

Is there a complete (effective) proof system for the logic?

Open problem 2

Is it always the case that $\Phi \models \psi \implies \Phi_0 \models \psi$ for some finite Φ_0 ?

• We do have: If every finite subset of Φ is satisfiable, then Φ is satisfiable.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○の�?

Is the set of validities recursively enumerable?

Is there a complete (effective) proof system for the logic?

Open problem 2

Is it always the case that $\Phi \models \psi \implies \Phi_0 \models \psi$ for some finite Φ_0 ?

• We do have: If every finite subset of Φ is satisfiable, then Φ is satisfiable.

Open problem 3

Is it possible to refute all non-entailments in a model with countable W and D?

I.e., do countable models suffice to characterize the logic?

In short Does InqBQ pattern with standard first-order logic or with second-order logic?

<ロト < 回 ト < 三 ト < 三 ト 三 の < で</p>

In short

Does InqBQ pattern with standard first-order logic or with second-order logic?

Key point

 \rightarrow introduces a second-order quantification on the state component:

$$s \models_g \varphi \rightarrow \psi \iff \forall t \subseteq s : t \models_g \varphi \text{ implies } t \models_g \psi$$

- Unclear whether a translation to FOL is possible.
- But also unclear how much second-order logic one can encode in InqBQ.

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬぐ

Part 4 Advances

Part 4.1 Well-behaved fragments

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

The classical antecedent (clant) fragment

We allow only classical formulas (i.e., \lor, \exists -free) as antecedents.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

A very broad fragment

All formulas that appeared in this talk are clant formulas:

- all classical formulas α
- ▶ polar questions ? α
- disjunctive questions $\alpha_1 \vee \ldots \vee \alpha_n$
- mention-some questions $\exists \bar{x} \alpha(\bar{x})$
- mention-all questions $\forall \overline{x}?\alpha(\overline{x})$
- ... and much more

Proposition If α is classical then

$$\mathbf{s}\models_{\mathbf{g}}\alpha\rightarrow\psi\iff\mathbf{s}\cap|\alpha|_{\mathbf{M}}\models_{\mathbf{g}}\psi$$

where $|\alpha|_M$ is the truth-set of α .

So, in the Clant fragment \rightarrow does not really introduce 2nd-order quantification.

(ロ)、(型)、(E)、(E)、 E) の(()

Clant completeness (Grilletti 2021)

The following natural deduction system is complete for the clant fragment.

Natural deduction system

Standard introduction/elimination rules for connectives, quantifiers, identity, plus following rules, where α is classical and $x \notin FV(\psi)$:

Constant domains	₩-split	∃ -split	Class ¬¬
$\forall x (\varphi(x) \lor \psi)$	$\alpha\rightarrow\psi\! \lor\! \chi$	$\alpha \to \exists x \varphi(x)$	$\neg \neg \alpha$
$\forall x \varphi(x) \lor \psi$	$\overline{(lpha o \psi) ee (lpha o \chi)}$	$\overline{\exists x(\alpha \to \varphi(x))}$	α

Example $\forall x(Px \leftrightarrow \neg Qx), \forall x?Px \models \forall x?Qx$

$$\frac{\frac{\forall x?Px}{?Py} \ (\forall e)}{\frac{\frac{\neg Qy}{?Qy} \ (\forall i)}{\frac{\neg Qy}{\forall x?Qx}} \ (\forall i)} \frac{(\neg Py]_1 \ \forall x(Px \leftrightarrow \neg Qx)}{(\forall i)} \ (\forall i)}{\frac{\frac{Qy}{?Qy} \ (\forall i)}{(\forall e, 1)}}$$
(class)

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

Example $\forall x(Px \leftrightarrow \neg Qx), \forall x?Px \models \forall x?Qx$

$$\frac{\frac{\forall x ? Px}{? Py} (\forall e)}{\frac{\frac{\neg Qy}{? Qy} (\forall i)}{\frac{\neg Qy}{? Qy} (\forall i)}} \begin{pmatrix} \text{class} \end{pmatrix} \frac{\frac{[\neg Py]_1}{\forall x (Px \leftrightarrow \neg Qx)}}{\frac{Qy}{? Qy} (\forall i)} \begin{pmatrix} \text{class} \end{pmatrix} \frac{\frac{\neg Qy}{? Qy} (\forall i)}{(\forall e, 1)}$$

Remark

- Wh-questions can be handled in inferences by pretty familiar rules.
- We built up these questions from simpler logical operators (∀, ∨, ¬); their logical properties follow from the properties of these operators.

The set of Clant validities is recursively enumerable.

The set of Clant validities is recursively enumerable.

Corollary

If $\Phi \cup \{\psi\}$ are clant formulas, $\Phi \models \psi$ implies $\Phi_0 \models \psi$ for some finite $\Phi_0 \subseteq \Phi$.

The set of Clant validities is recursively enumerable.

Corollary

If $\Phi \cup \{\psi\}$ are clant formulas, $\Phi \models \psi$ implies $\Phi_0 \models \psi$ for some finite $\Phi_0 \subseteq \Phi$.

Corollary

If $\Phi \cup \{\psi\}$ are clant formulas in a countable signature and $\Phi \not\models \psi$, the entailment can be refuted in a model with countable W and D.

The set of Clant validities is recursively enumerable.

Corollary

If $\Phi \cup \{\psi\}$ are clant formulas, $\Phi \models \psi$ implies $\Phi_0 \models \psi$ for some finite $\Phi_0 \subseteq \Phi$.

Corollary

If $\Phi \cup \{\psi\}$ are clant formulas in a countable signature and $\Phi \not\models \psi$, the entailment can be refuted in a model with countable W and D.

The Clant fragment seems like an attractive choice for a first-order inq logic:

- ▶ it extends FOL in a simple way and has a rich repertoire of questions;
- retains key meta-theoretic properties of FOL;
- admits a simple proof system in which questions can be manipulated.

Proposition

If a cardinality quantifier is definable in InqBQ, then for some finite n, it does not distinguish between cardinalities larger than n.

Take cardinality quantifiers (sensitive only to the cardinality of the extension): which such Q are definable in InqBQ (Qx.Px is equiv to an InqBQ-formula)?

Proposition

If a cardinality quantifier is definable in InqBQ, then for some finite n, it does not distinguish between cardinalities larger than n.

Corollary

The 'how many' quantifier is not definable in InqBQ, even wrt to finite models. That is, there is no formula expressing 'how many x are P'.

Future work

Study InqBQ + 'how many' quantifier

Conclusion

▲□▶ ▲□▶ ▲目▶ ▲目▶ 目 りへぐ

Using inquisitive semantics, we can enrich classical FOL with questions, resulting in an **inquisitive first-order logic**.

Using inquisitive semantics, we can enrich classical FOL with questions, resulting in an **inquisitive first-order logic**.

In this system we can regiment a broad variety of **first-order questions**, with an economical repertoire of primitives.

Using inquisitive semantics, we can enrich classical FOL with questions, resulting in an **inquisitive first-order logic**.

In this system we can regiment a broad variety of **first-order questions**, with an economical repertoire of primitives.

Relations of **answerhood** and **dependency** involving such questions are captured as cases of entailment.

Much recent progress:

- Axiomatization of broad fragments of InqBQ which are in themselves rich inquisitive extensions of FOL.
- Game-theoretic characterization of **expressive power**.
- Characterization of definable cardinality quantifiers.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 - のへで

Restricted existential (rex) fragment

 \exists only allowed to occur in antecedents of implication.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Key property

For every rex formula φ there exists $n_{\varphi} \in \mathbb{N}$ such that for all states *s*:

$$s \not\models_g \varphi \implies \exists t \subseteq s \text{ with } \#t \leq n_{\varphi} : t \not\models_g \varphi$$

Theorem (C.&Grilletti 2022)

An extension of the above proof system is complete w.r.t. rex conclusions. That is, if $\Phi \models \psi$ and ψ is a rex formula then $\Phi \vdash^+ \psi$.
