xdocConvertor -xDocConvertor provides scalable document transformation technology for high-fidelity XML content conversion, assembly and publishing solutions. The product is used to convert business oriented data in different file formats to XML format and convert XML format to any targeted output format. The product is built in JAVA.

TapPortal – TapPortal is a front end module of the TapConnect iPhone development framework. The portal is responsible for tracking, monitoring and managing all the stats of the iPhone applications registered with TapConnect. This project was made in ASP.net and C#.net using Sql server as Database.

gExchange – gExchnage is an email application that uses Outlook as a backend Email repository/Mail server. It displays and processes emails by email conversation Topic. For this we need to get Emails from Outlook and process them to create Conversations instead of individual emails and display the conversation in a user friendly IE browser application. Project also included optimization of data structures and used hashing techniques for providing

better efficiency. Project was built in C# and used ActiveX to communicate with Outlook.

Unreal Game Development – This project included development of various in game object for Unreal Tournament3.The project used Unreal Game Engine 3 APIs for creating different components, objects and environments of Unreal Tournament 3.

Bramerz
