Manufactured by S&C Biotech

Relaxin is a hormone which is produced by the corpus luteum when the fertilized egg implants. Relaxin will detect the presence of this hormone in the blood, and is a reliable and specific test for pregnancy diagnosis.

The test is best done approximately 30+ days after breeding.

Relaxin™ will also determine a pseudopregnancy since there will be no Relaxin circulating.

Relaxin testing is also important for monitoring pregnancy. Use Relaxin™ to detect any rapid drop in serum relaxin which would indicate a lost pregnancy.

Canine Relaxin Procedure

Collect blood in the small tube enclosed. Allow blood to sit 30 min at room temperature.

Spin or wait until Sera separates from blood.

- 1** Add 2 drops of Sera or Plasma to the Cassette.
- 2** Wait 10-15 minutes. Take Photo.

Two lines with very faint test line is pregnant.

No line is invalid.
