# Key features

01

Really blind Vickrey auction

04

DeAuction for group bid with interesting concept

02

No mappings, infinity amount of bids and DeParticipants

05

Well tested, **30** ts4 tests

03

A lot of custom configurations

06

Browser viewer for auctions

# Usage steps

*See full technical details in Github repository*

# Testing

# Auction and DeAuction phases

Both Auction and DeAuction have specific phases. All technical details are described in Github repository. The relation between those phases are shown here

# DeParticipant

DeParticipant is a user data for creation and interaction with DeAuction. It is deployed once for each wallet

The sample of such interaction (staking) is shown on diagram on left

# DeAuction price consensus

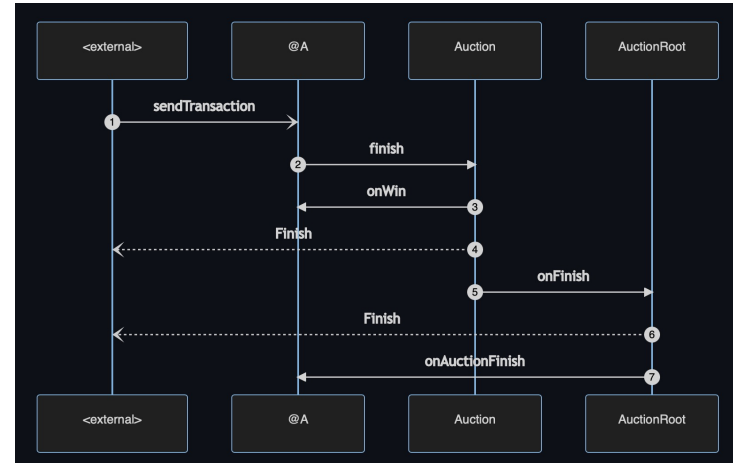

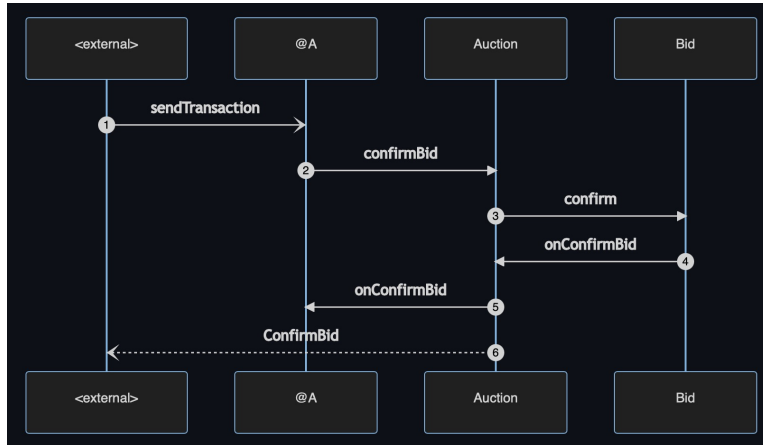

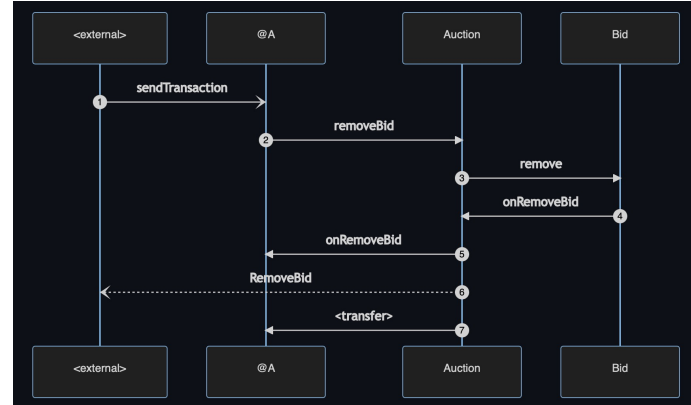

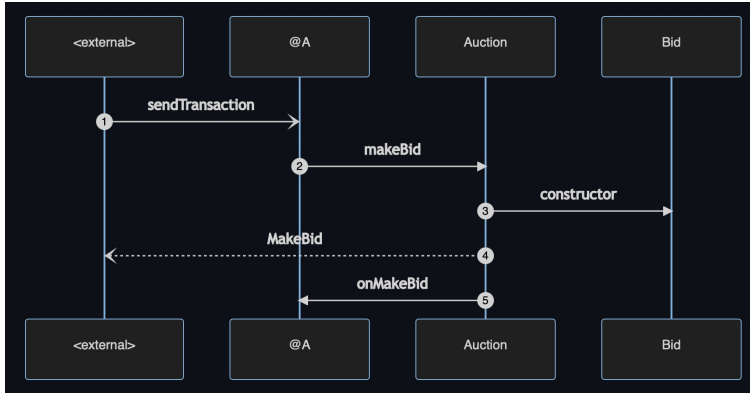

Consensus price are calculated as average between DeParticipant prices, where each price has weight of its owner's stake. Every DeParticipant can (but not must) provide a hash of desire price

If someone doesn't provide a desire price, or forget to confirm, then his price is not included in final price calculation. But his stake is participating and such DeParticipant will get his reward in case of winning

Consensus price formula: 
$$price_{consensus} = \frac{\sum_p^{participants} p_{stake} * p_{price}}{\sum_p^{participants} p_{stake}}$$
