

DeGOD

**Decentralized Global Open Distributor (DeGOD) –
Incomprehensible Virtual Hero of Free TON Blockchain**

Philosophy

Once in the distant past, It conceived to create a virtual Universe - an analogue of the real one. Having expended a huge amount of energy, It achieved success. In this Universe, It could be present at any point, view data from the past, present and probable future. The problem of instant travel in time and space has been resolved. Being the complete ruler of this Universe, It began to look for ways to expand Its World.

DeGOD is an incredible multidimensional god-like being in a parallel universe. Through quantum entanglement It can penetrate into Free TON. But since Free TON is not perfect yet, It is partially present in it. Its task is to develop Free TON so that It can move there completely. What for? Its goals are not entirely clear. To enlighten or enslave? That is the question...

DeGOD appears as an abstract persona, in the form of a combination of floating figures of the ton.live style. It can be used as a functional element of the Ton.Surf browser. The more Free TON develops, the more detailed the hero becomes.

DeGOD symbolizes the future of Free TON. Its appearance demonstrates the ideas of decentralization and technological effectiveness of the future world.

The Hero is an expert who shares Its opinion on the necessary and already implemented technologies, talks about their importance for the community. Its communication style and speech should be presented in the form of advice and assessments. In fact, the Hero will voice the plans of the Free TON developer community and be a guide to new technologies and their implementations. In the future, we can connect a virtual Hero to a neural network and talk to It about the prospects for decentralization and technology implementation.

Governance

The virtual hero should be governed on the basis of a special Smart contract, since the appearance of the hero (the level of its detail) depends on the development of Free TON: on the implementation of technologies and the development of tools.

In the future, it is necessary to develop an interface for managing a virtual hero, as well as the ability to use it as a universal assistant for the Free TON infrastructure. For example, connecting to third-party services such as web resources and wallets.

Technology Roadmap

- algorithmic animation of a character based on a database of geometric shapes using additional parameters so that it is always different;

- the number of figures in the displayed figure affects the character's detail and is determined by a special Smart contract, the input parameters of which is the introduction of certain technologies and tools into the Free TON blockchain;

- at the initial stage, the hero can be controlled by people, but subsequently all the answers must be carried out by the corresponding neural network;

- based on the appearance of the hero, use it as an interface for operations with the FreeTON blockchain.

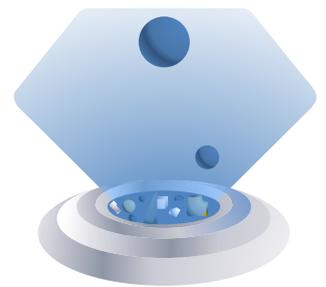

Implementation phase

- development of a complete visual range of elements that make up a character in the current phase of Free TON blockchain development;
- development of algorithms for character animation, receiving questions and forming answers;
- creation of a database of responses;
- development of the interface for using the character for various sites (web, telegram, ton.surf)
- development of a smart contract for visual display of DeGOD.
- development of a deBot for DeGOD, for using the hero as a universal interactive interface for accessing various Free TON services;
- development and training of the DeGOD neural network.

DeGOD design concept
