

Solution-SVM

Secure Virtual Meeting

Prevent authorized meetings from becoming unauthorized exposure events.

The Screen-Share Blind Spot

Traditional **file-based data loss** prevention protects the transfer of documents and repositories.

Screen sharing can **expose sensitive data faster than file sharing**. When information becomes visible on-screen during a live session, file protections cannot stop the exposure.

The Exposure Moment

A presenter shares their screen to collaborate. Confidential information is visible, but the environment has changed: external participants are present and the session is being recorded.

Defining the Risk Context

Intended Collaboration

Exposure Risk

Audience

Internal Team Only

External Guests /
Unknown Attendees Present

Environment

Unrecorded Session

FINANCIAL REPORT - CONFIDENTIAL

Intended Presentation Deck

Wrong Window Shared /
Background Application Exposed

Real-Time Exposure Control

1. Understand

Evaluate the live meeting context, the current audience, and the specific sensitive data visible on-screen.

2. Decide

Determine instantly whether the active screen-share is safe or risky based on corporate policy.

3. Act

Intervene exactly when exposure occurs, before it becomes a measurable data loss.

Automated Contextual Response

Warn: Instantly alert the presenter that external participants are viewing the screen.

Mask: Redact specific sensitive fields dynamically on the shared screen while the meeting continues.

Restrict / Stop Sharing: Immediately sever the screen-share connection if the wrong window or highly restricted content is exposed.

Preserve Evidence: Capture governed, privacy-aware context of the exposure event for audit and compliance.

Securing the Modern Workflow

Business Continuity

Security

Control intellectual property and sensitive data dynamically without blocking normal remote collaboration.

Compliance

Generate defensible, audit-ready evidence of real-time exposure controls during virtual meetings.

Leadership

Gain continuous visibility into a critical, previously unmonitored risk vector across the human edge.

Meetings are exposure points, not just collaboration events.
