

# 4U<sup>®</sup> Plates & Screws

*Cranio Maxillofacial*

**product**  
**CATALOGUE**

## OVERVIEW

### Thickness of plates:

- Micro Plates: 0.6mm
- Mini Plates: 1.0mm
- Mini Compression Plates: 1.0mm
- Reconstruction Mandibular Plates: 2.0mm
- Reconstruction Compression Plates: 1.7mm
- Mesh Plates: 0.5mm
- Chin Plates: 1.0mm

### Used in:

- Craniomaxillofacial surgery
- Orthognathic Surgery
- Trauma
- Neuro Surgery
- Reconstruction of mandible
- Hand Surgery

### Material:(the most ideal implant material Titanium)

- Titanium and Titanium Alloy
- Excellent Biocompatibility
- High Strength / Easily Formed To Match Bone Contours
- Static Free X-Ray, CT and MRI
- Non-Toxic in Biological Environment
- Corrosionproof
- Low Modules of Elasticity
- Good Pliability
- Antimagnetic
- Lightweight

**INSTRUCTIONS FOR USE: Bone Plates & Bone Screws****INDICATIONS**

These implants and accessories are intended for use in internal fixation of small bones affected by trauma or for reconstruction or arthrodesis.

**POSSIBLE ADVERSE EFFECTS**

In many instances, adverse results may be clinically related rather than implant related.

1. Osteoporosis, inhibited revascularization, bone resorption and poor bone formation can cause loosening, bending, cracking or fracturing of the device or premature loss of fixation with the bone, leading to nonunion.

2. Delayed union, malunion or nonunion of the fracture site resulting from improper alignment.

3. Increased fibrous tissue response around the fracture site due to unstable comminuted fractures.

4. Early or late infection, both deep and/or superficial.

5. Nerve damage may occur as a result of the surgical trauma.

6. Metal sensitivity reactions in patients following surgical implant have rarely been reported, and their significance awaits further clinical evaluation.

**WARNINGS AND PRECAUTIONS**

Responsibility for proper selection of patients, adequate training, experience in the choice and placement of implants and the decision to leave or remove implants postoperatively, rests with the surgeon.

The surgeon should discuss the expectations of surgery inherent in the use of the product with the patient. Particular attention should be given to a discussion postoperatively and the necessity for periodic medical follow-up.

The correct selection of the product is extremely important. The product should be used in the correct anatomic location, consistent with accepted standards for internal fixation. Failure to use the appropriate product for the application may result in a premature clinical failure. Failure to use the proper component to maintain adequate blood supply and provide rigid fixation may result in loosening, bending, or fracturing of the product and/or bone.

Careful handling and storage of the product is required. Scratching or damage to the component can significantly reduce the strength and fatigue resistance of the product.

Once applied, the product should never be reused. Although it may appear undamaged, previous stresses may have created imperfections that could reduce its service life.

The patient should be advised to report any unusual changes of the operated site to his surgeon. The patient should be closely monitored if a change at the fixation site has been detected. The surgeon should evaluate the possibility of subsequent clinical failure, and discuss with the patient the need for any measures deemed necessary to aid healing.

In all but mandibular bridging plate applications and for medical attention of arthrodeses, the implants are designed to function only until bony healing (usually 6-10 weeks). Delayed healing, nonunion or subsequent bone resorption or trauma may lead to excessive stress on the implant(s) and result in loosening, bending, cracking or fracturing.

**CLEANING**

- New products must be carefully cleaned before initial sterilization. Trained personnel must perform cleaning (manual and/or machine cleaning, ultrasound treatment, etc.) along with maintenance and mechanical inspection prior to initial sterilization.

**USE OF PRODUCTS**

Implants and instruments are produced and designed to be used together. The use of products from other manufacturers along with these products can involve incalculable risks and/or contamination of the material and misalignments of implant to instrument, thereby endangering the patient, user or third parties.

**STERILIZATION**

- Exact compliance is required with the manufacturers' user instructions for sterilizers.

- It is the responsibility of the user facility to make sure that special cleaning and sterilization methods are used for deactivation of specific pathogens and to validate sterilization cycles to account for differences in sterilization chambers, wrapping methods and load configurations.

- All non-sterile products are sterilizable by steam sterilization (autoclaving). For initial sterilization and resterilization of implant systems, the following parameters can be used:

Cycle Type	Prevac
Cycle Length	15 min
Temperature	270°C
Drying Time	60 min
Steam Pressure	30 PSI(206kPa)

**HANDLING INFORMATION**Implants

Bone plates and bone screws may be made of commercially pure (CP) titanium or Ti6Al4V alloy (acc. to ASTM F67, ASTM F136/ISO 5832 2,3) (see package or brochure for material used in the specific implant). Both materials are biocompatible, corrosion-resistant and non-toxic in the biological environment, and produce negligible artifacts by X-ray, CT and MRI.

Bone Plate Precautions

- Because titanium hardness increases and ductility (bendability) decreases due to cold working during the bending process, it is essential to ensure that the desired shape of the implant is reached in as few bends as possible. Excessive bending can lead to postoperative plate fracture.

- Extremely acute angles together with small bending radii must be avoided because of the potential risk for postoperative breakage.

- Excessively aggressive use of bending instruments can cause recognizable macroscopic damage to the implant (indentations, elongated screw holes, etc.). In such cases, the implant must be exchanged for a new, more carefully bent one.

- Deformed screw recesses signify not only an increased risk of breakage in these areas but also impair the accurate fit of the screw head to the plate.

- A cut bone plate segment to be implanted may require deburring (see brochure for suitable deburring instrument) to prevent soft tissue injuries or irritations.

Bone Screw Precautions

- If not otherwise expressly noted in the brochure, bone screws are self-tapping, obviating the use of a tap before bone screw insertion. Exceptions include (but are not limited to) when bone

- Regardless of the geometry of the screwdriver recess in the head of the bone screw (slot-pin, cross-slot, hex-fit, square-fit, etc.), it is essential to ensure that the screwdriver/screw head connection is exactly aligned in the vertical direction; otherwise there will be an increased risk of mechanical damage to the implant or the screwdriver.

- When engaging the bone screw, axial pressure of the screwdriver into the screw head must be adequately applied to ensure that the blade is fully inserted into the screw head. This results in axial alignment and full contact between driver and screw.

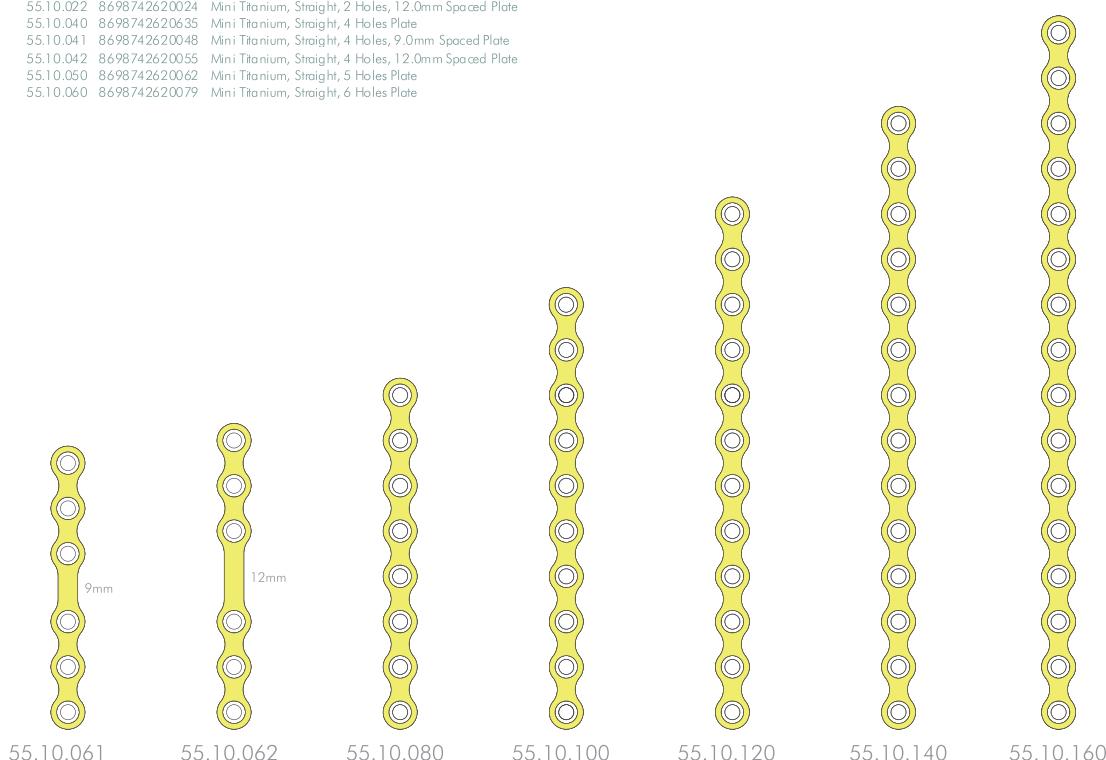

- In the final phase of screw insertion, the underside of the screw head contacts either the bone or the screw head recess of a bone plate, and a steep rise in resistance is clearly perceptible. Sensitive tightening of the screw must be exercised to reduce the risk of mechanical damage to the screw, screwdriver, or bony hole.
